

Fashion e-commerce is broken at the moment of decision

An AI-native styling layer on Myntra. Core insight: **people don't want to shop for clothes — they want to look good for a moment.**

Choice paralysis

9 lakh+ products. Users browse 40+ items per purchase. More options → harder decisions → **~70% cart abandonment**.

Fit uncertainty

The #1 driver of returns. **30–40% of fashion is returned** because static size charts ignore brand variation, fabric & body diversity.

No contextual intelligence

Keyword search can't understand "*something for a college fest under 2K*" — an occasion, a budget and a vibe in one sentence.

Labour-intensive discovery

Users are trapped in a browse → filter → scroll loop. No way to say "*like what that influencer wore, in my budget*".

Who it hits: the occasion shopper, the overwhelmed browser, the serial returner, the trend seeker. **Impact & hypothesis:** these directly cost revenue via lost conversion, costly reverse logistics & low engagement. Hypothesis — layering GenAI on the existing flow lifts conversion, cuts returns and raises order value without a re-platform.

These capabilities are categorically impossible with traditional ML

Traditional approach	Why it falls short	What GenAI unlocks
Collaborative filtering	Backward-looking — "people who bought X bought Y". Can't grasp a new intent.	LLM parses intent: occasion + budget + vibe + reference, all at once.
Keyword search	Matches tokens, not meaning. "red dress" yes; "Alia's look but under 3K" no.	NLU + reasoning over nuanced, multi-constraint natural language.
Static size charts	Lookup tables. Blind to "this brand runs slim in the shoulders".	LLM mines 1000s of unstructured reviews into a fit signal.
Rule-based recos	Suggests items; can't <i>compose</i> a coordinated, occasion-right outfit.	Generative composition — head-to-toe looks with creative judgement.
Manual catalog tagging	Can't read a Pinterest screenshot's aesthetic.	Multimodal (CLIP) maps image → catalog in a shared embedding space.

The unlock is the orchestration layer: LLMs provide *intelligence* (understanding & generation); a RAG pipeline over the live catalog provides *facts* (what Myntra actually sells). Intelligence + grounding = a trustworthy AI system, not a chatbot.

Who we serve & the high-level solution

Target users

- **The Occasion Shopper** — "I have an event in 3 days, dress me."
- **The Overwhelmed Browser** — adds to cart, abandons from choice fatigue.
- **The Returner** — buys 3, keeps 1; burned by fit.
- **The Trend Seeker** — Gen-Z, shops inspiration & references, not SKUs.

Core insight

Users think in **occasions, aesthetics & references** — not categories & keywords. The UI should meet them there.

The solution: StyleGenie

A GenAI layer dropped **on top of the existing Myntra app** (same UI, AI woven in) with five features spanning the journey:

- **StyleGenie Chat** — describe it, get curated looks
- **Visual Match** — snap any image → shop it
- **Outfit Studio** — generate complete coordinated looks
- **FitGenius** — your true size, with evidence
- **TrendPulse** — a daily, personal AI lookbook

Intent → discovery → confidence → checkout, each step de-frictioned.

04 · SOLUTION DEEP DIVE

Five features, one orchestration layer

StyleGenie Chat

NL query → intent classifier extracts occasion/budget/style → RAG retrieval → outfit cards stream in.

Visual Match

Upload image → CLIP embedding → nearest-neighbour vs catalog vectors → ranked matches.

Outfit Studio

Pick a product → LLM composes 3–5 colour-coordinated, occasion-tagged looks from real SKUs.

FitGenius

Body profile × NLP over 1000+ reviews → size + confidence + the evidence behind it.

TrendPulse

Social signals → LLM trend narrative × your style graph → daily personalised lookbook.

AI interaction layer

A floating concierge + inline AI cards on PDP — discoverable, never blocking the core flow.

REPRESENTATIVE USER FLOW — "OUTFIT FOR A COLLEGE FEST UNDER ₹2K"

User intent (chat / search)

LLM intent classifier

RAG retrieval over catalog embeddings

Outfit composition

Interactive cards · 1-tap "add look"

Measurable business impact

32% → <18%

Return rate (FitGenius) · ~₹525 Cr saved/yr

+18%

Conversion uplift (chat + visual discovery)

+22%

AOV via outfit bundling (+1.8 items/order)

+40%

DAU from daily TrendPulse check-in

35%

Visual-search → PDP CTR (vs keyword)

12%

Chat-to-cart conversion (3-month target)

Feature	Primary metric	Target	Measurement
StyleGenie Chat	Chat-to-cart conversion	12% in 3 months	Funnel analytics
Visual Match	Search-to-PDP CTR	35%	A/B vs keyword search
Outfit Studio	Items per order	+1.8 items	Order composition
FitGenius	Return rate	<18% (from 32%)	Cohort comparison
TrendPulse	DAU / session frequency	+40%	Engagement analytics

Projected annual impact: ₹800–1200 Cr revenue uplift + ₹400–525 Cr cost savings + ₹50–80 Cr premium subscriptions = ₹1200–1700 Cr net. Validated via a 50/50 A/B holdout over 4–6 weeks.

We designed for the hard parts

Risk	Concern	Mitigation
 Hallucinations	AI recommends products that don't exist.	RAG grounding — every response retrieved from the live catalog; the LLM never invents SKUs. Confidence scoring filters low-certainty output.
 Privacy	Users wary of sharing photos & body data.	On-device photo processing, explicit opt-in, transparent data policy, zero third-party sharing.
 Latency	AI too slow for a shopping flow.	Streaming responses, pre-computed embedding caches, edge-deployed CLIP. Target <2s.
 User trust	Users don't trust AI styling advice.	Show confidence + review evidence; manual override at every step; progressive trust-building.
 Scalability / cost	LLM cost explodes at 50M+ MAU.	Tiered models (cheap for simple, premium for complex), aggressive caching, batch for non-realtime.
 Adoption	Users ignore AI features.	Soft inline integration, contextual nudges on struggle signals, free tier + premium upsell.

The bottom line: StyleGenie isn't a bolt-on chatbot — it's an intent-first, grounded, measurable re-imagining of fashion discovery that reduces user effort *and* moves the numbers that matter to Myntra.
